It's not as bad as it might appear. The shutdown is affecting shitloads of games so I assume people will be working on GSA master server clones (there's already at least one written in C# for an older space game, but I can't remember the name).

All that needs to be done is for RenList to be updated. This can be done manually by hex editing RenList.EXE and changing the master.gamespy.com string embedded in the EXE, from the looks of it. Hopefully Adad will push a RenList updated instead though.

Oh and someone needs to host the clone master server which Jelly-Server agrees on.

I expected this to happen sooner or later. After i stopped playing last year the Player Counts has dropped, therefore it looks like a logical step.

-TLS-DJ-EYE-K wrote on Fri, 04 April 2014 08:22I expected this to happen sooner or later. After i stopped playing last year the Player Counts has dropped, therefore it looks like a logical step.

The Renegade player count has nothing to do with it, they're shutting down the entirety of GSA, not just the Renegade support.

On another note: If there are no suitable GSA clones that work for Renegade servers I'm sure I could whip something up, it's not exactly a complicated system. But I don't expect it'll be necessary given that Renegade/BRenBot don't use any special sauce in GSA broadcasts and should be compatible with any master server clones.

hifi is working on a GSA master server clone. Works with RenList and BrenBot GSA. Normal FDS GSA doesn't work and I can't get Dragonade's GSA support working either. Renegade Resurrection crashes with an exception. Havent tested the actual GameSpy Arcade software.

Need to figure out why Dragonade's GSA isn't working and then it's ready to go. For RR Launcher support and completeness some of the client <-> master server encryption support needs to be added.

Test server up at 62.113.196.140 ( renmaster.cncnet.org )

Code will be open-source most likely.

So I've been thinking and I doubt we'll get a host as stable as gamespy.com so it might be better to have two different GSA master server clone hosts, but that requires RenList to be updated to try and connect to a different server if the main server goes down.

It shouldn't be hard at all to make a stable GSA master server clone, there isn't anything particularly clever going on... read string in, shove it into a database, return results to client queries. Time out servers if they don't report for a certain length of time. I still have a copy of the official GSA protocol spec if anyone wants a copy to work from.

I'd be amazed if you couldn't knock up something functional and stable in a day or two. I can provide a stable DNS endpoint if that's what is needed (renlist.danpaul88.co.uk or something)... just give me an IP address to point it at. Heck, I could even host a master server on one of my RPi's, that's how small the requirements would be.

We already have clone software. I'm talking about the possibility of one of the hosts of the clone not being 'stable' in the sense that they can be down. Like when XWIS is down. To prevent that two GSA clone master servers can be used. It requires servers to broadcast to both and clients like RenList to be updated.

Both genblacky and danpaul88 are seperately looking into adding BRenBot support for broadcasting to a second server, BRenBot in past used to support broadcasting to GSA and ASE and the current code is modular.

It's very simple to do basically.

This is captain Iran speaking.

RenCorner marathon is using Dragonade 1.5 to broadcast to GSA. It's broadcasting to the clone at renmaster.cncnet.org with broken brenbot settings though:

```
[22:16:16] [22:16:16] <hifi>
\gamename\ccrenegade\gamever\838\hostname\hostport\mapname\C&C_Under_RxD\g
ametype\C&C\numplayers\12\maxplayers\50\CSVR\1\DED\1\password\0\DG\TC\FF\
SC\SSC\brenbot1.54.243\timeleft\0.00.00\Website\www.renforums.com\queryid\2699. 1
[22:16:37] [22:16:37] <hifi> but it doesn't have the port anywhere
[22:16:42] [22:16:42] <hifi> hostport and hostname are both empty
```

Dragonade 1.5 seems to work fine with the clone, it's used by MPF UltraAOW to broadcast there. It's just lacking support for multiple GSA master servers.

Something which Brenbot misses is info for both teams, score/kills/deaths. Dragonade shows two fake players called 'Nod' and 'GDI' to show this info. hifi would like this info to be added to BRenBot for his server list at <http://cncnet.org/renegade-servers>

BrenBot also doesn't allow you to use a custom value for the 'gametype' option while Dragonade 1.5 does. hifi wants to use that to display gametype info.

[View Forum Message](#) <> [Reply to Message](#)

---

The hostname which RenCorner Marathon is sending is empty. Doesn't seem to be a BRenBot issue, just a configuration one as other servers running BRenBot show up fine.

---

There are three requests:

1. Allow the 'gametype' option to be configurable, at the moment it always sends 'C&C'. Dragonade 1.5 already allows this and hifi might add support for displaying it in the online server list.
2. Add player kills/death/time to player info.
3. Add two fake players Nod and GDI with team score/kills/death.

iRANian wrote on Sat, 28 June 2014 22:46The hostname which RenCorner Marathon is sending is empty. Doesn't seem to be a BRenBot issue, just a configuration one as other servers running BRenBot show up fine.

There are three requests:

1. Allow the 'gametype' option to be configurable, at the moment it always sends 'C&C'. Dragonade 1.5 already allows this and hifi might add support for displaying it in the online server list.
2. Add player kills/death/time to player info.
3. Add two fake players Nod and GDI with team score/kills/death.

Fake players is a bad idea, however the GSA spec already has a correct way for sending team scores so I'll add support for that.

This goes in the players response and looks like this;  
`\score_t0\100\score_t1\150`

Updated copy of the GSA plugin for BRenBot 1.54, you don't have to replace your XML file unless you want to use the new game\_type config value, it will default to C&C if you don't have the entry.

Also added renmaster.cncnet.org as a default entry in the master servers list.

Note that this version of the plugin more closely follows the GSA spec and sends player teams as numericals rather than strings. The string for the team name is contained in the new team data which is sent as part of this update (`\team_t#\teamnamehere\score_t#\teamscorehere`). Clients which do not follow the GSA spec correctly might require updates to render this correctly.

Revision: 311  
Author: danpaul88  
Date: 29 June 2014 11:15:50  
Message:

Updated GSA plugin to 1.1

- Added player kills and deaths to player data response
- Added team names and scores to player data response
- Player teams now show their numerical ID instead of the textual name (clients should read the name from `\team_t#\name\` instead, where # is the players indicated team)
- Support for setting a custom gametype via config XML

- Added renmaster.cncnet.org to list of default master servers in config XML

Awesome

Rencorner marathon is now showing the current hostname on CnCNet. hifi wrote a launcher to handle renegade:// URIs and I'm almost done writing an installer for it.

Where does BRenBot read the port it uses to broadcast too and receive data from clients from?

Could people test this installer for me? It should find your Renegade directory and ask you to install to it. Afterwards you should be able to connect to servers listed on <http://cncnet.org/renegade-servers> by clicking on their IP address on that page.

I'd need to see the actual raw query strings it's sending back really to see what the problem is (assuming its not a parsing issue in your client)

542\final\queryid\1174.2
```

Player info isn't sent, not sure if it's because of the double queryid. RenList doesn't show the team\_tX and team\_tX as options in the left pane where it shows raw options like gametype..I think it's parsing it as a player and hence it showing a bugged GDI player in the player list.

Here's how it looks for Dragonade:

```

iRANian wrote on Tue, 01 July 2014 09:18 Player info isn't sent, not sure if it's because of the double queryid.

BRenBot breaks the response down into smaller chunks because there is a limit on the maximum amount of data in each query, hence why there are two query IDs (those correspond to separate UDP packets, the master server software's job is to reconstruct all the packets with the same queryid in order of the .# component and use that as the final packet).

---

Subject: Re: GameSpy Arcade

Posted by [iRANian](#) on Tue, 01 Jul 2014 09:14:11 GMT

[View Forum Message](#) <> [Reply to Message](#)

---

The master server doesn't do that, it's strictly client to BRenBot communication. All that the master server does is keep a list of server IPs+Ports that the client should query directly for info. The query response I copy pasted from WireShark which showed my IP communicating with all the Renegade servers on the list directly, e.g. showed Jelly-Marathon's IP with the query data bytes/packets.

The problem is that player info isn't being sent, the fake player on GDI is probably showing up because RenList doesn't parse stuff properly and thinks the team Nod and team GDI scores info represent a GDI player.

BTW how do you know the team\_tX and score\_tX are part of the GameSpy spec?

---

Subject: Re: GameSpy Arcade

Posted by [danpaul88](#) on Tue, 01 Jul 2014 14:43:50 GMT

[View Forum Message](#) <> [Reply to Message](#)

---

From the GSA spec;

Quote:Note the difference between "team\_0" (which would indicate which team player 0 is on) and "team\_t0" (which would indicate the name for team 0).

Also

Quote:If you define a key that ends with an underscore and then a number (such as score\_1), it is assumed to be a custom player field and will be displayed by GameSpy on the player list. If the key ends in an underscore then a "t" and a number (such as score\_t1) it is assumed to be a custom team field and will be displayed by GameSpy on the team list.

So, anything that is \_t# is a team property and anything that is \_# is a player property.

The issue with the player list info not getting sent is this:

```
my %playerList = plugin::get_playerlist();  
my $numPlayers = scalar(keys %playerList);
```

```
my $i = 0;
my $string = "";
```

```
# Send player data in batches of 15 players to avoid overrunning the length limitations
while (my ($id, $player) = each(%playerlist))
```

```
while (my ($id, $player) = each(%playerlist))
```

'playerlist' should be 'playerList'.

^ thanks for iran's help, i'll commit the fix to svn right now

P.S. I committed two SVN revisions, one of which fixes the spelling error, and one of which reverses danpaul's change to make the team id be displayed instead of team name, which can be gathered from the team listing if properly read. My bad. You can reverse that if you wish DP, but for the meantime RenList does not display it very correctly.

I'm guessing he made that change because of the mods that use different team names - don't hate me, I committed it before I read the log for your gamespy.pm change. :(

I'm guessing he made that change because of the mods that use different team names - don't hate me, I committed it before I read the log for your gamespy.pm change. ;(

I see you reverted it anyway, but for future reference you shouldn't use `brTeams::` in plugins anyway, `plugin::team_get_name(#)` is what you would use (and is actually in used about 10 lines further down from your edit to output the team names based on teams.cfg)

And yes, it is for mod support... and not just for BHP mods either. In theory things like RP2 might want different team names etc and this is the correct way to do that as per the developer spec

@Iran good spot with the capital L, I usually use playerlist without the capital and probably copy/pasted the for each loop from somewhere else when I moved the code into a plugin. I hadn't had time to look into why it wasn't working since I was at work all day, but now I guess I won't need to bother

For anyone who hasn't got a copy and wants one, I have attached version 1.03 which includes the aforementioned fix

I was using the latest version of gamespy.pm from the SVN when I found that %playerList was misspelled; I don't know if it's like that in the older versions. Regardless, RenList doesn't correctly implement the team logic at this time, so the player list may still act a little funny. Adad has been notified, though.

On our server through RenList, the first player's team would get messed up in some way, so I commented it out for the time being until RenList can be fixed.

EDIT: Duly noted about using plugins:: namespace, I didn't bother to look if that function was present in there. I will next time.

I think you must have edited your post, the cvar stuff wasn't there when I originally wrote my reply above (or I didn't notice it, always a possibility).

Anyway, those settings look correct to me so I don't see why it wouldn't be listed on both masters.

You could try using something like wireshark to check it is actually sending packets to both master servers and see if there is some sort of error connecting to the original GSA master?

I'm saying it should be pinned because its rather important, possibly in multiple locations, IE Renegade Client and mod release. Because if a new player wants to play this game they either have to go on an easter egg hunt for reenlist or they have to deal with xpis registration.

The Renegade GSA master server is still up even after the services for all the other C&C games were shutdown a few days.

They probably do not even realize Renegade has GSA. It will probably be removed when they start to question why some mysterious connections are being made to the servers.

Yup, can confirm that it no longer works with Resurrection Launcher's GSA client.
