I have been thinking about my server I run it so often it would probably be more pratical to just buy a neuther computer just to run the server.

So I have a few questions for you.

If I was just going to buy a computer just to run a Dedicated renagade server that would hold 12 people what would I need for hardwahir spesafecations also take into accont that I would try make it Linux.

I don't want to spend much money one it about $200 Canadian or less.
So I want to know what the min hardwhair specs I would need are.

How much prosseser speed would I need could I do it with anything less than a 500?
Would I even need a video card?
How big of Hard Disk Driver would 2 gig be big enugh?
what hardwahir would I not need at all and what could I borow from my other computer becues I would not need it much Like a moneter keyboard mouse CD rom drive ect..
Thankyou for your pashenc and help

You'd probably need about 800 mHz to run 12 players. 128 MB of RAM. You do need a video card, but get the very lowest-end one you can find. You might even be able to find someone who has one they're not using.

2 gig will be fine for a hard drive.
You wouldn't need a sound card.

If you set up SSH or regular Telnet on your Linux box, you can connect to it from your main computer using Putty and control it, eliminating the need for an extra keyboard and monitor.

For more help, visit the Linux forum.

To run a dedicated server box, there is NO need for a video card. My server no longer has one. I use a remote control program called Proxy 4.0 you connect to it through another computer with Proxy 4.0 Master installed. I access 7 computers from around the country. 3 of them are running game servers. 1 BF 1942 and 2 Renegade Servers, ontop of my own. This is what it looks like. I am in this old shot connected to my game server, my wife's computer and my friends comp in Florida (CyBrg2112 Sniper Server).

So don't spend money on a video card and a monitor for a box that is going to be strictly used as a server, for anything i.e. game server, web serving and FTP. Most business' don't even have a video card or a montior running off their main servers. They Proxy in to them.
