Do you have the REOL mod installed? Everyone I know having the problem you describe was having trouble because they were connecting to the REOL servserv which was down at the time.

I had the same problem, do this

Load Note pad and open C:\windows\system32\drivers\etc\hosts You might have to change the drop down bar to all files not just text files

It should look a little bit like this:

\#
\# This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
\#
\# This file contains the mappings of IP addresses to host names. Each
\# entry should be kept on an individual line. The IP address should
\# be placed in the first column followed by the corresponding host name.
\# The IP address and the host name should be separated by at least one
\# space.
\#
\# Additionally, comments (such as these) may be inserted on individual
\# lines or following the machine name denoted by a '\#' symbol.
\#
\# For example:
\#
\# 102.54.94.97 rhino.acme.com \# source server
\# 38.25.63.10 x.acme.com \# x client host

127.0.0.1 localhost

Something like that, mine had some servr.westwood.com shit in it, just delete that line and save
then load renegade and should work, may need reboot depending on if your pc is gay

Delete all the .pkg's in you data folder. It will stop the Requesting Server list window from
freezing.........It worked for me.
