Hi

I have my own clan server running on Linux, you can play on it you can ftp to it, but do you think I can bloody connect to it via renrem. I have the correct syntax but it just wont connect. I have checked the password and ports all match up. Is there a known problem or am I missing something ?

Anyhelp would be very much appreciated.

The LFDS renrem support is broken. Mac created a workaround which you should be able to find if you search the threads in this forum.
