Hello everybody,

I hope you can help me with the following problem:

I installed renegade a couple of weeks ago, but I had a lot of performance problems and Renegade didn't work so well. Now are those performance problems gone and I can play renegade, but the problem is at some points windows gets a BSOD and renegade quits. Some of those points are:

- When my gun is empty
- When I start a campaign
- When I pressed ESC during a game and I want to return to the game.

There may be more points where I get this BSOD, but I didn't find them yet, and I'm not gonna look for them.

The only thing I have changed is that the resolution is set back from 1024 x 768 to 800 x 600. My PC specs are the following (the renegade min spec's are behind it between ()):

Windows 98 SE (windows 98/2000/ME/XP)

PIII 450 Mhz (PII 400 Mhz)

128 Mb RAM (96 MB RAM)

8 GB free (700 Mb for the game)

36x or higher (4x)

16 Mb on the VGA card (16 Mb)

3D accelerator (3D accelerator)

640 Kbit (56,6)

What can be the problem?

Another problem I got is when Renegade quits the windows bar's are white instead of gray, does someone know the solutions for this to?

Greetz, Cybertinus

ps: I'm sorry for my bad English, I just can't type it very good, I'm from The Netherlands.

Actually your english is amazing. I would never have guessed you were from the Netherlands.

As for your problem. It certainly is an odd one. Never before have I heard of something like this happening.

I'm no expert but it looks like you simply have a computer that's too outdated to run the game.

FerhagoActually your english is amazing. I would never have guessed you were from the netherlands.

Thnx for the compliment

FerhagoAs for your problem. It certainly is a an odd one. Never before have I heard of something like this happening.

Im no expert but it looks like you simply have a computer thats too outdated to run the game.

That my computer is too outdated I have heared before, but the specs are better then the mimum requerments, so that shouldn't be the problem.

Hmmm. Do you have any other programs running while renegade is running? You may have some and not even know it. Things like anti virus software or kazaa that start automatically.

If so then those programs may be eating up your RAM

I have "some" other programs running. This is the list:

- Apache webserver
- MySQL server
- SETI@Home (SETI@Home stands for Search for Extraterrestrial Intelligence At Home, so a program who seach for aliens)
- 2 program's that support SETI@Home
- Virusscan

Tomorow I'm gonna try to run Renegade whitout those programs. Maybe it works then

Yeah that seems like too many programs to be running for only 128 RAM

I have tried to run renegade without those programs, but Renegade still crashes, what is the problem

And it is not that the programs where started and then killed, they where just never started
