I have a server in a data center and to run lfd's i use `./renegade_server`

(via putty - ssh prog)

when i disconnect from ssh, the server also shuts down, is there anyway to keep it running?
thanks

Use it with a "screen".

You should run my renegade wrapper available at <http://www.brenbot.com/wrapper>. That way, you can run it in the background by running it with `nohup ./renegade_server &`

You also get remote administration capability that you will need for brenbot, which is an application you definitely want to run.

The wrapper opens up a open TCP port for incoming telnet connections. You can use it from the outside as well. It has nothing todo with SSH.

Lets Say it opens port 4853 (default). It displays this on startup.

Then you can connect from the outside using your box's ip and port 4853 using putty (select telnet)
