Hey guys!

I have downloaded Far Cry from the gamepro site, and have gotten really bad performance. Whenever I launch a game and it loads up, right when it starts I either have one or a mixture of the following: good fps missing textures such as water/radar/gunmodels, bad fps missing textures, or blue bars running across the screen every time I move. Also these problems persist whether everything is on high or low detail.

I can run high end games such as Halo PC (can set everything to high on SP without too much trouble), or play UTK4 fine....ect. My comp specs are:
2600+ athalon
Gig of RAM
120 Gigs of memory, with 40 Gigs being used
GeForce 5900 FX

So I'm not sure exactly what is going on, but I want the game since my clan is probably going to play/compete in it, I want to be sure that this won't happen with the full version of the game, and that it is only the demo that is messing up, and the full version won't.....

I've had the exact same problem. I asked on their forums and never got an answer so I just deleted it.

Only reply I have gotten so far is "look in the older post when the demo came out", but they weren't much help as of yet. I've been able to make it playable with everything on low, but there are still a lot of texture issues that are like the VIS erros in renegade maps. I guess I'll buy the game, hopefully they fixed whatever is causing this, because this is a 2-3 month old demo that I downloaded yesterday.

Well the demo is unlikely to get patched. In the full version i'd think that they would recognize the problem and deal with it. Thats just my guess though. I haven't played the demo or full.

yeah the only thing I can think of is it is not compatible with my drivers or something like that.

well, i can say from experience, the Demo that is on the web (from january) is pretty buggy, and there will be a demo being launched soon that people can download that contains mp as well. it will also be a lot less buggy.

best thing to do is make sure you have the newest nvidia drivers, they are pretty specific on a minimal version of drivers for the demo.

Well, my problems we opposite. My demo worked fine and the full version killed my fps for some reason. I took out the 128mb ATI RADEON 8500 and put in my 64mb GeForce4 MX NVIDIA with the latest drivers, and what do you know, FarCry works fine.

I couldn't even play the demo. When the map loaded, all I got was warped meshes all over the screen and low FPS. I could still see where I was going in the boat but it was still unplayable.

forsaken

120 Gigs of memory, with 40 Gigs being used

That's alot of memory you have there! I think you mean HDD Space
