Since the RG client can auto identify with a BRenBot-moderated server, is there any chance of adding that type of feature for BR .Net as well?

That depends... how does one identify with BR.NET?

You have to page the host of the server with something like !id

snipesimoYou have to page the host of the server with something like !id <pass>

The master server send the password to the SSC. From there, the SSC has to do whatever is needed to authenticate the user. If the SSC is not part of the main program, I don't think it can do anything like that.

Yeah, and we have no way of paging the server from the client... it doesn't hook into Renegade that far.

I will talk to Dante about it, maybe he can have his SSC communicate directly with BR .Net or something...
